

Three-point adapter

» Fully galvanized version

Agricultural businesses and contractors use a variety of attachments for tractor front loaders in their operations. Previously they could only be used on front loaders. Now with the three-point rear adapter for front loader attachments, developed by specialists of the Fliegl Agro-Center GmbH in Kastl, Germany, existing soil buckets, manure forks and bale fork, etc. can easily be coupled and used with the rear hydraulics.

The special feature of the three-point rear adapter from Fliegl is its latch mechanism, which can be used for tipping, unloading and setting down loads and transported material without difficulty. This eliminates inconvenient manual work. The Fliegl tipping mechanism can be triggered simply by cable pull with the rear hydraulics lowered. Lowering engages the mechanism again and the attachment is then once again securely connected with the tractor.
